```

The invention relates to bovine fertility associated antigen (FAA) and its nucleic acid sequence. FAA is useful for increasing the stability of the plasma membrane plus acrosome of a sperm cell and/or other portions of a sperm cell, in particular mammalian sperm cell such as a sperm cell from buffalo, cow, horse, mice, pig, sheep, human, avian sperm cell from cell such as a sperm cell including turkey or chicken sperm cell. FAA is also useful for increasing the fertility of sperm from a mammal including buffalo, cow, horse, mice, pig, sheep or human, or avian (chicken or turkey). FAA is added to the suspension of sperm cells prior to preservation or prior to administration of the sperm cells to a mammal in artificial insemination. Alternatively, fertility of sperm from a mammal is increased by placing FAA into a female's reproductive tract prior to deposition of the sperm cells insemination. The female mammal is increased by injecting insemination. The female mammal is increased by injecting FAA into the male mammal's reproductive tract. The present sequence is Novel amino acid and polynucleotide sequence for fertility associated antigen useful for increasing stability of plasma membrane, acrosome and other portions of sperm cell, and increasing fertility of mammals Claim 1; Fig 6; 37pp; English. Novel amino acid and polynucleotide sequence for fertility associated antigen useful for increasing stability of plasma membrane, acrosome and other portions of sperm cell, and increasing fertility of mammals

Claim 1; Fig 5; 37pp; English.

The invention relates to bovine fertility associated antigen (FAA) and its nucleic acid sequence. FAA is useful for increasing the stability of the plasma membrane plus acrosome of a sperm cell and/or other portions of a sperm cell, in particular mammalian sperm cell such as a sperm cell including turkey or chicken sperm cell. FAA is also useful for increasing the fertility of sperm from a mammal including buffalo, cow, horse, mice, pig, sheep or human, or avian (chicken or turkey). FAA is added to the suspension of sperm cells prior to preservation or prior to amice, pig, sheep or human, or avian (chicken or turkey). FAA is added to the suspension of sperm cells for a mammal in artificial insemination. Alternatively, fertility of sperm from a mammal is increased by placing calls into the female's reproductive tract prior to deposition of the sperm cells into the female's reproductive tract by copulation or artificial insemination. The fertility of the male mammal is increased by injecting the insemination. The fertility of the male mammal is increased by injecting the male mammal's reproductive tract. The present sequence is bovine 22kDa recombinant FAA (rFAA) coding sequence.

antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful CC for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single cc the fertility of a human male by administering FAA. Detecting single nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP CC in the mammal and correlating the presence or absence with the fertility of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the CC fitness of a human or bovine, by determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP and correlating the frequency of the FAA SNP to the reproductive fitness of the mammals. FAA improves the integrity of sperm combranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification of infertility improves the prognosis for subsequent attempts at fertilisation and CC facilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional containing containing the costly and/or emotional containing containing the first for subsequent attempts at fertilisation and containing the fertility treatments to avoid costly and/or emotional containing the first for subsequent attempts at fertility associated antigen (FAA) described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 25; Fig 2A-E; 54pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence of a FAA SNP of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP quantifying the frequency of the FAA SNP cothe correlating the frequency of the FAA SNP to the reproductive fitness of a mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification of infertility improves the prognosis for subsequent attempts at fertilisation and improves the prognosis for subsequent attempts at fertilisation and improves the prognosis for subsequent attempts at fertilisation and fertilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional problems with attempted inseminations. This sequence encodes the human

Claim

```
The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver curve tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cycostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fifth the proposition of the published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

```
The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity, (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in corpusion is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical result as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine infiltrating ductal cancer, stement.
                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

This DNA sequence encodes a novel human LS-DNase (AAW23542), which has DNA-hydrolytic activity but is resistant to inhibition by actin. It can be used for reducing the viscoelasticity or viscous consistency of be used for reducing the viscoelasticity or viscous consistency of DNA-containing material, as well as treatment of systemic lupus erythematosus or pulmonary disease of disorders such as cystic fibrosis, bronchitis, pneumonial, bronchiectasis, emphysema, asthma, tuberculosis or fungal infections. It can also be used for adjunctive treatment of abscesses or severe closed-space infections in conditions such as certaininglis, peritorialis, sinusitis, otilis, peritodontis, peritorialis, cholelithiasis, endocarditis and serior arthritis as well as in topical treatments in a variety of inflammatory and infected lesions, erg. of the skin and mucosal commentanes, surgical wounds, ulcerative lesions and burns. LS-DNase may improve the efficacy of antibiotics used in the treatment of such infing to intext DNA). It can also be used for the treatment of other con-infected conditions in which there is an accumulation of cellular cubulo-interstital kidney disease. It can also be used in in vitro diagnostic assays of a viscous material (e.g. sputum) from a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nostic assays of a viscous material (e.g. sputum) from a patient. anti-LS-DNase antibodies can be used for detection and purification
                                                                       DNase; actin; DNA viscoelasticity; systemic lupus erythematosus; cystic fibrosis; meningitis; pulmonary disease; gene therapy; recombinant preparation; DNA-hydrolytic activity; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated LS-DNase which is resistant to inhibition by a used for the treatment of e.g systemic lupus erythematosus pulmonary diseases and disorders such as cystic fibrosis

CC GC, where differential expression of Gs is indicative of GCA.
Also included are modulating (M2) GA by contacting GC with an agent
CC that alters the expression of it least one gene in Gs; (2) screening (M3)
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CS subject to a pathogen or sterile inflammatory disease using the
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CC subject to a pathogen or sterile inflammatory disease using the
CC chronic) in a tissue, an allergic response in a subject, exposure of a
CC subject to a pathogen or sterile inflammatory disease, by detecting the
CC level of expression in a sample of the tissue of gene(s) from Gs, where
CC the level of expression of the gene is indicative of inflammation;
CC (4) treating (M5) an inflammation (especially chronic) or in a tissue,
CC an allergic response in a subject, exposure of a subject to a pathogen
CC inflammation with an agent that modulates the expression of gene(s)
CC from Gs in the tissue. M1 is useful for detecting a firsue having
CC from Gs in the tissue. M1 is useful for detecting an agent capable of modulating
CC detecting an inflammation (especially chronic) in a tissue, an allergic
CC response in a subject, exposure of a subject to a pathogen or sterile
CC inflammatory disease (e.g. psoriasis, rheumatoid arthritis,
CC parasitic infection, protozoal infection, fungal infection and M5 is
CC useful for treating one of the above conditions. The present
CC useful for treating one of the above conditions. The present
CC the printed specification, but was obtained in electronic
CC format directly from Wipo at
CC format directly from Wipo at The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated ftp.wipo.int/pub/published_pct_sequences λq

DNase-gamma has a mol. wt. of 32000 by SDS-PAGE, or 30000 by gel filtration, an optimum H of 5.6, is found in the cell nucleus, is not dependent on divalent cations, has a Zn(2+) inhibition IC(50) > 1mM and leaves 3'-OH and 5'-P termini after cleavage. The DNase can be used at a mol. leval to resolve the control mechanisms of carcinogenesis, the autoimmune system and AIDS development. It can also be used in the diagnosis, prevention and treatment of cancer, autoimmune disease, viral infections, etc.,

A 649 base pair CC dragment of the coding sequence of cloned human LS-DNase (ART74076) was used to screen a murine liver cDNA library and obtain this nucleotide. CC Murine mature LS-DNase is 84% identical to human LS-DNase. A portion of the present sequence was used in Northern blot assays of various murine CC tissues. Expression of murine LS-DNase mRNA was found to be highest in CC the liver and spleen. Human LS-DNase and be used for reducing the CC viscoelasticity or viscous consistency of DNA-containing material, as CC well as treatment of systemic lupus exythematosus or pulmonary disease CC disorders such as cystic fibrosis. It can also be used for adjunctive treatment of abscesses or severe closed-space infections, e.g. CC meningitis. It may improve the efficacy of antibiotics used in the CC treatment of such infections (e.g. gentamicin activity is markedly creduced by reversible binding to intact DNA). It can also be used in in CC vitro diagnostic assays of a viscous material (e.g. sputum) from a cultivation of itc. Mase antibodies can be used for detection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
The invention describes a novel isolated human fertility-associated antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the fertility of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single nucleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence with the fertility of the mammal and correlating the presence or absence with the fertility of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNPs are chosen from FAA SNPs 1-34 given in the specification. FAA SNP is also useful for determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing the FAA SNP and correlating the frequency of the FAA SNP to the fitness of the mammals. FAA improves the integrity of sperm membranes and increases the capacitation of sperm derived from either fertile or infertile humans. Early genetic identification of infertility

                                                       fertility-associated antigen (FAA), HC2, one of 4 partial prostate cDNA clones of the novel FAA gene described in the method of the invention.
             facilitates early intervention to determine whether the individual may benefit from fertility treatments to avoid costly and/or emotional problems with attempted inseminations. This sequence encodes the human
                                                                                                                                                                                                                                                                                                                                                                                 240

antigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful for increasing the stability of a sperm cell acrosome and for increasing the stability of a perministering FAA. Detecting single conclude polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence of a FAA SNP in the mammal and correlating the presence or absence of a FAA SNP in the mammal and correlating the presence or absence of a FAA SNP correlating the presence or absence of a FAA SNP in the FAA SNP is also useful for determining the reproductive fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP quantifying the fertility of more than one mammal containing the FAA SNP and correlating the frequency of the FAA SNP to the correlating the frequency of the FAA SNP to the reproductive fitness of the mammals. FAA improves the integrity of sperm derived from either correlating the capacitation of sperm derived from either correlating the reproductive fitness of the mammals. FAA improves the indevidual may correlating the respective determine whether the individual may correlating for subsequent attempts at fertilisation and the facility recataments to avoid costly and/or emotional correlating estility associated antigen (FAA), HC3, one of 4 partial prostate cDNA concept the novel FAA gene described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   296
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention describes a novel isolated human fertility-associated cantigen (FAA) and a bovine FAA polypeptide. Human or bovine FAA is useful CC for increasing the stability of a sperm cell acrosome and for increasing the fertility of a human male by administering FAA. Detecting single CC funcleotide polymorphisms (SNPs) of the human or bovine FAA gene is useful for assaying fertility by detecting the presence or absence of a FAA SNP in the mammal and correlating the presence or absence with the fertility CC of the mammal. The FAA SNPs are chosen from FAA SNPs 1-34 given in the Specification. FAA SNP is also useful for determining the reproductive CC fitness of a human or bovine, by determining the nucleotide sequence of the FAA SNP, quantifying the fertility of more than one mammal containing the FAA SNP and correlating the frequency of the FAA SNP to the frequency of the FAA SNP to the CC reproductive fitness of the mammals. FAA improves the integrity of sperm CC membranes and increases the capacitation of sperm derived from either CC fertile bumans. Early genetic identification of infertility CC improves the prognosis for subsequent attempts at fertilisation and CC facilitates early intervention to determine whether the individual may CC consess with attempted inneminations. This sequence encodes the human CC fertility-associated antigen (FAA), HC4, one of 4 partial prostate CDNA CC clones of the novel FAA gene described in the method of the invention.
